## AMENDMENTS TO THE SPECIFICATION

Please amend the section entitled DETAILED DESCRIPTION OF THE INVENTION on page 8, second paragraph, at lines 10-15 as follows:

As previously stated, the domain matrix 14 is formed from the combination of the matrix islands 18 and exists as a discontinuous matrix of polymeric material. The uncoated filaments 16 fixed by matrix islands 18 permit the prepreg dimensional flexibility not previously known. The structure of the present invention allows transmission of gases and liquids. Furthermore, the matrix free areas may be filled with other resins to achieve desired properties or characteristics of the composite.
